STORAGEVAULT
CANADA SELF STORAGE CENTRES

Round 2 – Panel Interview & Technical Consultant Assignment

Overview

In this stage, you will complete a hands-on Salesforce implementation exercise and present your solution to a panel of team members. The goal is not to build a perfect solution, but to show how you think, communicate, and translate business requirements into Salesforce configuration.

The exercise has three components:

1. **Requirements Gathering Discussion (10–15 min)**
2. **Solution Presentation (10 min)**
3. **Live Demo + Build (15–20 min)**

You will have agreed upon time to prepare your solution after receiving the assignment.

The Scenario

StorageVault Canada is expanding its Portable Storage business, and the sales team wants a simple way to track customer requests, container availability, delivery timelines, and pricing — all natively inside Salesforce.

You have been asked to design a Minimum Viable Product (MVP) solution using standard Salesforce features.

Business Requirements

1. New Business Process

CSR agents receive calls from customers who want to rent a portable storage container. Each request follows these steps:

1. **Lead arrives** via website or phone
2. **CSR validates the address**, service area, and preferred delivery date
3. **CSR checks container availability**
4. **CSR sends a quote**

5. **If accepted**, the customer is converted into an Opportunity
6. **CSR schedules delivery**

The sales team wants this entire workflow tracked in Salesforce.

What You Must Build (MVP)

A. Data Model

Design a simple data model that includes:

- Customer
- Container Request
- Container Inventory
- Service Location / Delivery Address

Candidates must decide which objects to use:

- Standard objects only OR
- Standard + custom objects

B. Screens Needed for the Process

Build (or outline how you would build):

1. **Lead intake screen**
2. **Screen for** CSR agents to create a Container Request
3. **Opportunity view** that shows requested delivery date, address, and selected container

C. Automation Requirements

Automation must:

- Create a Container Request when a CSR selects “Portable Storage Inquiry”
- Prevent assignment of a container if the delivery date overlaps with an existing booking
- Auto-populate pricing based on container type
- Update Opportunity Stage when request is accepted

D. Reporting

Build the following:

1. Container Availability Report
2. Upcoming Deliveries Dashboard Component

Deliverables Candidates Present in the Panel

1. Requirements Summary (Slide Deck)

- StorageVault’s portable storage workflow
- Key objects and relationships
- Assumptions you made
- Limitations and trade-offs

2. System Design Slides

3. Live Configuration Demo
